

Objective: Create a full stack application that allows a user to input any recipe link from [allrecipes.com](https://www.allrecipes.com). Then generate modified recipes that correspond to the “Featured Tweaks” reviews. Make a scrappy solution, do not overthink it. But do make the UI intuitive/easy to read.

Deadline: Within 48 hours of sending. This should take 5-10 hours total.

Tech stack: Up to you but must use js or ts. Frontend and backend must be hosted somewhere.

Assessment: Main part is whether it works without hiccups. After that, whether the code is readable and modular. No tests are required.

Submission: The first hour must be recorded, please share it as a gdrive file. Make sure it's publicly viewable. Share the site link and a short video of your implementation working on a recipe. Send everything to antwallolive@gmail.com.

Share the repo with my gh, username is kleenkanteen.

More details:

Here is an example of a recipe:

<https://www.allrecipes.com/recipe/236372/chef-johns-summer-scrambled-eggs/>

Towards the bottom you will see a featured tweaks section where users mention what kind of modifications they enjoy doing:

I loved this recipe! I sautéed some chopped canadian bacon and onion along with the halved tomatoes before I added the eggs. The flavor was great, and it solved the problem of the water from the tomatoes. I had some crumbly English cheddar in my frig, and that worked fine. With cherry tomatoes and basil in my garden, I'll be making this a lot this summer!

The main page of your site should let the user input a recipe, and then your application should scrape every featured tweak to create a modified recipe per tweak. These should show up as a list, intuitive enough to switch between the modifications. Persist these modifications so they can be revisited later.

Show the modified parts of recipes with visual highlights, sort of like a GitHub pr diff.

Please make sure this will work on any recipe. There might be edge cases where things can go wrong but that's okay. As long as it works reliably for most recipes.
